

Testing motor skills is as easy as MABC

Having a quick and reliable tool to identify motor coordination delays is imperative in ensuring interventions are put in place as early as possible, and in gauging the efficacy of those interventions over time. For many Occupational Therapists and Physiotherapists, School and Neuro Psychologists, and other professionals all over the world, that tool is the Movement ABC-3.

The updated Movement ABC-3 includes all of the features and benefits of the bestselling previous edition, with some modifications that will expand its usefulness and make it even more user-friendly. Some of these changes include:

- An expanded age range that extends its use from 3 years up to 25 years
- An additional manual dexterity item per age band
- An additional throwing and catching item per age band
- Digital scoring and reporting options on Q-global
- Revised and enhanced Qualitative Observations for each task
- Expanded and updated caregiver/self Checklists for each age band
- Greater alignment of tasks between age bands, and between the Test and Checklist
- Checklist manual and forms available separately for users who don't need the full kit
